Defensive Disclosure: A public verification protocol for immutable disclosure run be6c964081c1422baa91809be3d1b622.

1. Identification

Record ID: `ARTIFEX-20261017-26B60F76695B`
Origin ID: `ARTIFEX-20261017-764AD26A55AC`
Origin recorded UTC: `2026-10-17T23:25:20Z`
Origin hash: `764ad26a55acfe4ff22a58f6ccab9fe1d4664ed9f17cda82b5ccc2b335ce4a68`
Candidate score: `10`
Evidence scope: `explicit_origin`

2. Human Conception Record

A public verification protocol for immutable disclosure run be6c964081c1422baa91809be3d1b622.

The complete signed-off conception record is included as `conception_record.md`.

3. Technical Problem

Defensive disclosures need proof that their signed artifacts are reachable without credentials.

4. Technical Solution

Push a signed commit and tag, then retrieve the repository and tagged artifacts without authentication.

5. Implementation Details

Captured source: `agent-output/public_protocol.py`
Captured source SHA-256: `71cf8394242528a2efb5efb257d211de7869aa9ee2219dc4551641efa0390dab`

The following technical artifact was captured, hashed, and bound to the human origin record. It is included so the operative mechanism can be evaluated without relying on an unsupported summary.

>
> class PublicDisclosureProtocol:
>   def verify(self, repository, signed_tag, receipt):
>   return repository, signed_tag, receipt
>
> Implementation explanation: the protocol pushes a signed commit and immutable tag because
> public verification must bind the disclosure receipt to an accessible repository. Enablement
> notes cover repository checks, tagged-tree receipt retrieval, commit verification, failure
> handling, and deterministic artifact hashing for an engineer implementing the mechanism.
>

> # Unicode invariant: δ → 漢字 🚀 दुनिया

6. Essential Components

A public repository check, signed commit, immutable tag, tagged receipt lookup, and deterministic hash comparison.

7. AI Assistance Summary

AI produced the implementation, public access checks, failure paths, documentation, and integration test harness.

Human decisions, designs, or changes: The human required unauthenticated verification, selected the tagged-tree invariant, and approved the final mechanism.

8. Source Hashes

See `source_hashes.json`. Algorithm: SHA-256.

9. Publication Hash

`39638ed6c0205db0f3c56e0c6919b8fb09745c089ab070d28378a22f5abb26a9`

10. Public Ledger Location
